Sway bar extension link

1. These Toyota sway bar links have been designed to suit lifts of approximately 2 inches (50mm) to 4 inches (100mm). For most lifts around 2 - 4 inches the sway bar extensions will be at their shortest length (this will be around 30 - 35mm longer than standard depending on the vehicle. Confirm this with the centre measurement below). Depending on the shocks fitted and the desired outcome, the male threaded end of the sway bar link may need to be cut shorter to suit the desired outcome. If required the link can then be made longer however it is important to check the suspension throughout its full range of travel to check for any issues relating to spring trapment, topping, binding, fouling, and bottoming of the sway bar, sway bar links, control arms and other components.
2. Completely remove the male threaded section and apply thread lock to the threaded section.
3. Set the desired centre length.
4. Lock the lower locking nut firm.
